MANAGE RISK AND STANDARDIZE SERVICE DELIVERY

- » Follow best-practice password management—generate strong passwords, eliminate password re-use, and automate routine password maintenance.
- » Grant or revoke access quickly to avoid lending credentials to new technicians, and instantly revoke access when technicians leave.
- » Simplify the documentation process by following MSP-proven standards around what to document, and how.
- » Capture and share knowledge using prebuilt, MSP-centric templates, or create your own templates with the built-in editor.

SHORTEN INCIDENT RESOLUTION TIMES

- » Auto-capture new credentials directly into the vault to help ensure all authorized technicians have access when needed.
- » Eliminate copy-and-paste errors and time wasted searching for updated credentials or dealing with account lockouts.
- » Put everything your technicians need to provide service just a click away: link passwords, documents, kb articles, certificates, serial numbers, and more.
- » Deliver consistent service to your entire client base, regardless of technician turnover.

HELP DEMONSTRATE COMPLIANCE FOR CREDENTIAL CREATION, USAGE, AND STORAGE

- » Adopt and demonstrate best-practice password-management workflows, track changes, enforce strong passwords, and set password expiry.
- » Report audit-level proof points to help meet compliance requirements.
- » Monitor credential usage to easily identify what happened (and when) in terms of access.
- » Measure and enforce password complexity to boost cyberhygiene.
